

Nordic Anti-Icing Cargo delivered to Jernbaneverket

Nordic Ground Support Equipment (Nordic GSE) has delivered the newly developed Nordic Anti-Icing Cargo 40 000 to Jernbaneverket, the Norwegian National Rail Administration.

Nordic GSE has finished installation of one Nordic Anti-Icing Cargo system in the cargo terminal of Alnabru, Oslo.

Jernbaneverket can now offer anti- / de-icing service to all cargo operators, thus helping them to keep trains in traffic during winter, while also reducing the heavy maintenance costs caused by ice.

“We are proud that Jernbaneverket has chosen the unique solution from Nordic GSE to prevent ice build-ups on cargo trains”, says Jules Lajola, Managing Director of Nordic GSE.

Background of Nordic De-/Anti-Icing

The first Nordic De-/Anti-Icing system was delivered already in 2005/2006. Nordic GSE has thus many years of experience in advanced customized systems for both anti- and de-icing. Our high-quality systems have proved very reliable.

The patented system has been developed in Sweden, where R&D and production are still located. The Scandinavian origin guarantees top-quality industrial parts and advanced IT functions.

Our customers include the Swedish and Finnish State Railways as well as Mantena, the service company of the Norwegian State Railways.

How it works

The environmentally friendly Nordic De-/Anti-Icing is a unique system designed for mainly anti-icing service.

Heated fluid is sprayed onto the train, where it stays as a protective layer and prevents ice build-ups. Thus, the system significantly reduces the need for time- and energy-consuming de-icing.

Excess fluid and melted water are collected on trays. The fluid is then purified in an automated process to be re-used in the next treatment.

In addition, the Nordic Anti-Icing Cargo 40 000 has powerful melting capacity and large tanks, which improves the de-icing capabilities.

The system applies the fluid under low pressure, and the method has been approved by various train manufacturers. The Nordic De-/Anti-Icing systems are equipped with several IT functions, which facilitates service, maintenance and monitoring.
